Subject: Stone

Have been looking at old emails. The legacy stone house that we talked about is thick stone. I can't do precast surrounds around veneer stone. The precast is too thick. What I was thinking about with this is to case the windows with azek from the factory. This would be a 3.5 inch casing around the window, so the stone would not be butted up next to the window, the stone would be butted up next to the casing. A subtle and nice look. We could then do a rollock of stone over the window head. A rollock is lined up stones of the same size on end over the window. I think I could find a way to do your entrance in precast. Its keeping me up at night. Exciting.
